Scaled Bernoulli numbers

This worksheet is a supplement to: Marc Mezzarobba, *Rounding Error Analysis of Linear Recurrences Using Generating Series*. It illustrates how some of the calculations of the section on scaled Bernoulli numbers can be checked using Maple.

```
> restart;
```

Define the auxiliary series S-caron, b-sharp-star. Double-check the associated inequalities.

```
> Sc := w/sin(w);
```

$$Sc := \frac{w}{\sin(w)} \tag{1}$$

```
> series(w/sinh(w), w, 12);
```

$$1 - \frac{1}{6} w^2 + \frac{7}{360} w^4 - \frac{31}{15120} w^6 + \frac{127}{604800} w^8 - \frac{73}{3421440} w^{10} + O(w^{12}) \tag{2}$$

```
> series(Sc, w, 12);
```

$$1 + \frac{1}{6} w^2 + \frac{7}{360} w^4 + \frac{31}{15120} w^6 + \frac{127}{604800} w^8 + \frac{73}{3421440} w^{10} + O(w^{12}) \tag{3}$$

```
> bs := 2 - w/tan(w);
```

$$bs := 2 - \frac{w}{\tan(w)} \tag{4}$$

```
> seq(bernoulli(2*k)/(2*k)!, k=0..5);
```

$$1, \frac{1}{12}, -\frac{1}{720}, \frac{1}{30240}, -\frac{1}{1209600}, \frac{1}{47900160} \tag{5}$$

```
> series(subs(w=sqrt(z)/2, bs), z);
```

$$1 + \frac{1}{12} z + \frac{1}{720} z^2 + \frac{1}{30240} z^3 + \frac{1}{1209600} z^4 + \frac{1}{47900160} z^5 + O(z^6) \tag{6}$$

Define C-tilde-star, S-tilde-star.

```
> a := 1 + u;
```

$$a := 1 + u \tag{7}$$

```
> Ct := cosh(a*w) - cosh(w);
```

$$Ct := \cosh((1+u)w) - \cosh(w) \tag{8}$$

```
> St := w^(-1)*(sinh(a^2*w) - sinh(w)) - (a^2-1);
```

$$St := \frac{\sinh((1+u)^2 w) - \sinh(w)}{w} - (1+u)^2 + 1 \tag{9}$$

Now define maj = delta-hat-star in terms of the series introduced so far.

```
> num := Ct+St*bs
```

$$num := \left(\frac{\sinh((1+u)^2 w) - \sinh(w)}{w} - (1+u)^2 + 1 \right) \left(2 - \frac{w}{\tan(w)} \right) + \cosh((1 \tag{10}$$
$$+ u)w) - \cosh(w)$$

```
> den := 1/Sc-St
```

$$den := \frac{\sin(w)}{w} - \frac{\sinh((1+u)^2 w) - \sinh(w)}{w} + (1+u)^2 - 1 \tag{11}$$

```
> maj := num/den
```

$$maj := \left(\left(\frac{\sinh((1+u)^2 w) - \sinh(w)}{w} - (1+u)^2 + 1 \right) \left(2 - \frac{w}{\tan(w)} \right) + \cosh((1 \tag{12} \right.$$
$$\left. + u)w) - \cosh(w) \right) \bigg/ \left(\frac{\sin(w)}{w} - \frac{\sinh((1+u)^2 w) - \sinh(w)}{w} + (1+u)^2 - 1 \right)$$

(We could have used solve(), but the form above will be more convenient to work with than the one solve() returns.)

```
> normal(maj - solve(maj1 = Sc*Ct + Sc*St*bs + Sc*St*maj1, maj1));
```

$$0 \tag{13}$$

Behavior of maj as u → 0. First, the series expansion with respect to u.

```
> ser := simplify(convert(series(maj, u, 2), exp), exp);
```

$$ser := \frac{\left(\left(\left(e^{2w}+1\right)e^{-w}-2\right)\left(2-\frac{w\cos(w)}{\sin(w)}\right)+\frac{\left(e^{2w}-1\right)e^{-w}w}{2}\right)w}{\sin(w)}u+O(u^2) \quad \textbf{(14)}$$

Extract the leading term xi-hat and rewrite it in a nicer form.

```
> xih := op(1, ser);
```

$$xih := \frac{\left(\left(\left(e^{2w}+1\right)e^{-w}-2\right)\left(2-\frac{w\cos(w)}{\sin(w)}\right)+\frac{\left(e^{2w}-1\right)e^{-w}w}{2}\right)w}{\sin(w)} \quad \textbf{(15)}$$

```
> xih := collect(expand(xih), [sin, cos, w], e -> simplify(convert
  (e, trig), trig));
```

$$xih := \frac{\sinh(w)\,w^2+(4\cosh(w)-4)\,w}{\sin(w)}+\frac{(-2\cosh(w)+2)\,w^2\cos(w)}{\sin(w)^2} \quad \textbf{(16)}$$

Singular expansion of x-hat at its poles. We isolate the singular factor for readability.

```
> aux := xih*(1 - (w/Pi)^2)^2;
```

$$aux := \left(\frac{\sinh(w)\,w^2+(4\cosh(w)-4)\,w}{\sin(w)}+\frac{(-2\cosh(w)+2)\,w^2\cos(w)}{\sin(w)^2}\right)\left(1-\frac{w^2}{\pi^2}\right)^2 \quad \textbf{(17)}$$

```
> simplify(MultiSeries[series](aux, w=Pi, 4));
```

$$8\cosh(\pi)-8+\frac{4\pi\sinh(\pi)+8\cosh(\pi)-8}{\pi}(w-\pi)+O\!\left((w-\pi)^2\right) \quad \textbf{(18)}$$

The function studied in Lemma 18, i.e., the denominator of maj divided by Sc.
```
> h := St - 1/Sc;
```

$$h := \frac{\sinh\left((1+u)^2 w\right) - \sinh(w)}{w} - (1+u)^2 + 1 - \frac{\sin(w)}{w}$$ (19)

```
> eval(h, u=0)
```

$$-\frac{\sin(w)}{w}$$ (20)

```
> plot(eval(h, u=1e-10), w=-3*Pi..3*Pi)
```

```
> plots[complexplot3d](eval(h, u=1e-10), w=6.2*(-1-I)..6.2*(1+I))
```

The term St vanishes identically when u=0, leaving us with the zeros of sin(w)/w. We focus on the zero at w=π. The Implicit Function Theorem applies, so that the zero varies analytically with u for small enough u.

```
> eval(diff(h, w),[w=Pi,u=0]);
```

$$\frac{1}{\pi} \tag{21}$$

```
> phi := RootOf(subs(w=Pi/(1+_Z), h)):
> phiser := simplify(convert(series(phi, u, 3), trig));
```

$$phiser := \left(2\cosh(\pi) - 2\right)u + \left(6\pi\sinh(\pi) - 2\pi\sinh(2\pi) + \cosh(\pi) - 1\right)u^2 + O(u^3) \tag{22}$$

```
> theK := op(1,phiser)
```

$$theK := 2\cosh(\pi) - 2 \tag{23}$$

```
> G := sinh(w) - w - w^3/6
```
$$G := \sinh(w) - w - \frac{w^3}{6} \tag{24}$$

Check that a²w0 < π

```
> w0 := Pi/(1+K*u)
```

$$w0 := \frac{\pi}{Ku + 1} \tag{25}$$

```
> plot(subs(K=theK, a^2*w0/Pi), u=0..1/2)
```

```
> solve(diff(a^2*w0, u), u)
```

$$-1, \frac{K-2}{K} \tag{26}$$

Double-check some algebraic identities used in the proof

```
> normal((w0-Pi) + K*u*w0)
```

$$0 \tag{27}$$

```
> St_alt := (a^6-1)*w^2/6 + (subs(w=a^2*w, G) - G)/w
```

$$St\_alt := \frac{\left(\left(1+u\right)^6-1\right)w^2}{6} \tag{28}$$

$$+ \frac{\sinh\left(\left(1+u\right)^2 w\right) - \left(1+u\right)^2 w - \dfrac{\left(1+u\right)^6 w^3}{6} - \sinh(w) + w + \dfrac{w^3}{6}}{w}$$

```
> normal(St-St_alt)
```

$$0 \tag{29}$$

Upper bound on h(w0), and a quick check that it is negative

```
> hhat := (a^6-1)/6*w0^2 + (a^2-1)*(K-Pi^2)/(2) - K*u + (K*u)^3*
  w0^2/6
```

$$hhat := \frac{\left((1+u)^6 - 1\right)\pi^2}{6\,(Ku+1)^2} + \frac{\left((1+u)^2 - 1\right)\left(-\pi^2 + K\right)}{2} - Ku + \frac{K^3 u^3 \pi^2}{6\,(Ku+1)^2} \tag{30}$$

```
> sort(collect(numer(hhat)/6, [u,Pi]), u, ascending)
```

$$\left((-2K+2)\pi^2 + \frac{K}{2}\right)u^2 + \left(\left(\frac{1}{6}K^3 - K^2 - K + \frac{10}{3}\right)\pi^2 + K^2\right)u^3 + \left(\left(-\frac{K^2}{2} + \frac{5}{2}\right)\pi^2 \tag{31}$$
$$+ \frac{K^3}{2}\right)u^4 + \pi^2 u^5 + \frac{\pi^2 u^6}{6}$$

```
> plot(subs(K = op(1,phiser), hhat), u=-2^(-8)..2^(-5))
```

```
> RootFinding[Analytic](diff(subs(K = op(1,phiser), numer(hhat)),
  u), u, re=0..2^(-5), im=-1..1)
```
$$0.0223706820632626, \; 0. \; I \tag{32}$$

$|\sin(w)|$, $|w|=\rho$ is minimal for real w. Argument vaguely inspired by https://math.stackexchange.com/a/1322980: write $w=\rho(x+iy)$. The expression $\cosh(\rho\cdot y)$ reaches its global minimum at $y=0$, corresponding to $x=\pm1$, and is increasing for $y\geq0$. To the left of $x=1$, $\cos(\rho\cdot x)$ is initially decreasing up to $x=3\pi/(2\rho)$, where $\cosh(y)$ is already large enough that $\cosh(\rho y)^2 - \cos(\rho x)^2 \geq \cosh(\rho y)^2 - 1 > |\sin(C)|^2$.

```
> sqabssin := simplify(abs(sin(rho*exp(I*theta)))^2) assuming
  theta::real
```

$$sqabssin := \left|\sin\left(\rho\,e^{I\theta}\right)\right|^2 \tag{33}$$

> **rho := 62/10**

$$\rho := \frac{31}{5} \tag{34}$$

> **plot(sqabssin, theta=-Pi..Pi)**

Check the condition of Rouché's theorem. Maple's support for rigorous numerical computations is poor; we redo the check using interval arithmetic in the accompanying SageMath worksheet.

> **evalf(eval(expand(a^2-1)*(1+cosh(a^2*rho)), u=2^(-16)))**

$$0.007550782584 \tag{35}$$

> **evalf(abs(sin(rho)/rho))**

$$0.01340151659 \tag{36}$$

Singular expansion at alpha of delta-hat-star (proof of Proposition 19)

```
> zz_alpha := RootOf(-h, w); # apparently it needs to be -h, not h,
  for MultiSeries[series] to succeed
```

$$zz\_alpha := RootOf\left(\_Z\,u^2 + 2\,\_Z\,u + \sin(\_Z) - \sinh\left((1+u)^2\,\_Z\right) + \sinh(\_Z)\right) \tag{37}$$

```
> alias(alpha = zz_alpha)
```

$$\alpha \tag{38}$$

```
> ser := MultiSeries[series](maj, w=alpha, 2)
```

$$ser := -\left(\left(\cos(\alpha)\,\alpha^2\,u^2 - 2\,\sin(\alpha)\,\alpha\,u^2 + 2\,\cos(\alpha)\,\alpha^2\,u + \cosh(\alpha\,(1+u))\,\alpha\sin(\alpha)\right.\right. \tag{39}$$

$$-\cosh(\alpha)\,\alpha\sin(\alpha) - \sinh\left(\alpha\,(1+u)^2\right)\cos(\alpha)\,\alpha + \sinh(\alpha)\,\cos(\alpha)\,\alpha - 4\sin(\alpha)\,\alpha\,u$$

$$\left.+ 2\sinh\left(\alpha\,(1+u)^2\right)\sin(\alpha) - 2\sinh(\alpha)\,\sin(\alpha)\right)\alpha\right)\bigg/\left(\sin(\alpha)\,\left(\cosh(\alpha\,(1\right.\right.$$

$$\left.+u)^2\right)\alpha\,u^2 + 2\cosh\left(\alpha\,(1+u)^2\right)\alpha\,u + \cosh\left(\alpha\,(1+u)^2\right)\alpha - \alpha\cosh(\alpha) - \alpha\cos(\alpha)$$

$$\left.\left.-\sinh\left(\alpha\,(1+u)^2\right) + \sinh(\alpha) + \sin(\alpha)\right)\right)(w-\alpha)^{-1} + O\left((w-\alpha)^0\right)$$

```
> rew := isolate(subs(_Z=alpha,op(zz_alpha)),sinh((1+u)^2*alpha))
```

$$rew := \sinh\left(\alpha\,(1+u)^2\right) = \alpha\,u^2 + 2\,\alpha\,u + \sinh(\alpha) + \sin(\alpha) \tag{40}$$

```
> ser := simplify(subs(rew,ser))
```

$$ser := \frac{-\cosh(\alpha\,(1+u))\,\alpha + (\cos(\alpha) + \cosh(\alpha))\,\alpha - 2\sin(\alpha)}{(1+u)^2\cosh\left(\alpha\,(1+u)^2\right) - u^2 - 2\,u - \cos(\alpha) - \cosh(\alpha)}\,(w-\alpha)^{-1} + O\left((w \right. \tag{41}$$

$$\left.-\alpha)^0\right)$$

The auxiliary function R

```
> R := normal(convert(ser, polynom)*(1-w/alpha)):
> R := subs(_a=alpha,simplify(combine(subs(alpha=_a, R))))
```

$$R := \frac{\cosh(\alpha\,(1+u))\,\alpha - \alpha\cosh(\alpha) - \alpha\cos(\alpha) + 2\sin(\alpha)}{\alpha\left((1+u)^2\cosh\left(\alpha\,(1+u)^2\right) - u^2 - 2\,u - \cos(\alpha) - \cosh(\alpha)\right)} \tag{42}$$

Double-check the expression for R given in the paper

```
> simplify(1/R*(subs(w=alpha,Ct)-cos(alpha)+2*sin(alpha)/alpha)/
  (subs(w=alpha,diff(w*St,w))-cos(alpha)))
```

$$1 \tag{43}$$

Asymptotics of R as u → 0

```
> serR := simplify(subs(_Z1=1,MultiSeries:-series(R, u, 2)))
```

$$serR := 1 + (-1)^{-Z1}\left(\pi\,\_Z1\sinh(\pi\,\_Z1) - 2\cosh(\pi\,\_Z1) + 2\right)u + O(u^2) \tag{44}$$

```
> evalf(serR)
```

$$1. + (-1.)^{-Z1}\left(3.141592654\,\_Z1\sinh(3.141592654\,\_Z1) - 2.\cosh(3.141592654\,\_Z1) + 2.\right)u \tag{45}$$

$$+ O(u^2)$$

The derivative of R. After a non-rigorous look at its values, we generate a straight-line program implementing the expression that we use in the accompanying SageMath notebook to compute rigorous enclosures.

```
> dR := (diff(R, u)):
> plot(subs(alpha=Pi/(1+theK*u), dR), u=0..2^(-16))
```
```
> lprint(codegen[optimize](dR))
